

# Mosos <CTG> WebConsole

- insight into 'live' CTGs through the internet -

## Innovation in care

At BMA, we work every day on the innovation and improvement of care in the Netherlands. Our newest product is Mosos <CTG> WebConsole, which makes it possible to review CTG data from Mosos, and provide it with supplementary information, through the web. This creates many advantages, starting with an improvement in care.

## Why Mosos <CTG> WebConsole?

Because Mosos <CTG> WebConsole by BMA improves the care for mother and child. Currently, the situation is such that when direct input of the gynaecologist is needed on the floor, the doctor must either come to the hospital or the CTG registration has to be faxed to the gynaecologist. From the point of view of flexibility, efficiency and reliability, a fax is (for example) not always even clear, and this is not an ideal situation. This changes with Mosos <CTG> WebConsole. The gynaecologist - and every other authorised user of Mosos <CTG> - can now log in anywhere, and provide advice on the basis of the patient data offered by the web. As a result, the Web Console offers the prospect of more flexible and reliable care for mother and child. More efficient, faster and better.

## Mosos <CTG> WebConsole: better insight, better care

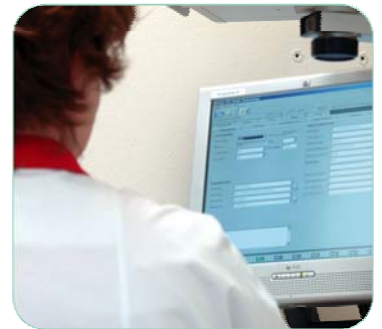

Mosos <CTG> WebConsole by BMA was developed on the basis of web technology. This means that it is from now on possible to get real-time access through the internet to a CTG that is recorded in the delivery room. Thanks to this new Mosos application, the physician on call can be at home and yet easily obtain insight into the condition of the patient in the delivery room, without the intervention of others. And not only at home, since the web technology of the WebConsole guarantees, always and everywhere, real-time access to a CTG. Whether at home or at a different location, in or outside of the hospital. Mosos <CTG> WebConsole: better care begins at BMA.

## Characteristics of Mosos <CTG> WebConsole

- Based on web technology
- Conforms to safety requirements in regard to privacy of patient data
- Low threshold and user friendly
- Connects seamlessly to Mosos <CTG>
- Relevant patient data always and everywhere available
- Access to all notes of the parturition report
- Memo functionality
- Insight into all CTGs, including live CTG
- Possibility to evaluate the CTG recording

## The advantages of Mosos <CTG> WebConsole

- Simple and secure access to patient data through the web
- Faster, more efficient and better care at a distance
- More mobility and flexibility for the user of Mosos <CTG>

*Since its' establishment in 1985, BMA has developed and implemented information systems for the support of the activities within second-line obstetric care. This takes place in close cooperation with the users. Our many years of expertise and our participation in various (research) projects with universities and the government enable us to deliver complete solutions for this care sector.*
